

## Lesson 48: Student's t-distribution

Previously, when constructing confidence intervals, we made the assumption that we knew the true population standard deviation,  $\sigma$ . When we do not know the population standard deviation,  $\sigma$ , we must estimate it from our sample using the sample standard deviation,  $s_x$ . However, when we do so, the test statistic,  $z$ , changes to a new test statistic called the **t-statistic**, and has a new distribution (density curve) associated with it.

	Standard Z-curve	Standard T-curve
Centered at	0	0
Area under	1	1
Shape	Symmetric Bell	Symmetric Bell
Width and Height	Always the same curve.	Curve changes based on the sample size. Low sample size creates a wider, shorter curve. High sample size creates a narrow, taller curve. As sample size increases, the shape of the t-curve approaches the shape of the z-curve.
Calculations	Areas left and right can be calculated based on the mean, standard deviation, and a value.	Areas left and right can be calculated based on the mean, standard deviation, a value, and the degrees of freedom.  Degrees of freedom = $n - 1$

## Calculations from tables

The Normal Curve (Z)	The Students T Curve (T)																																																																																																																																																										
<p>Table entry for <math>z</math> is the probability lying below <math>z</math>.</p> 	<p>Table entry for <math>p</math> and <math>C</math> is the point <math>t^*</math> with probability <math>p</math> lying above it and probability <math>C</math> lying between <math>-t^*</math> and <math>t^*</math>.</p>

Margins are z-values	Top margin = probability Left margin = degrees of freedom																																																																																																																																																										
Inside = probability	Inside value = T-value																																																																																																																																																										
Probability is area to the left	Probability is area to the right																																																																																																																																																										

**Note: both are in the AP STAT Program!**

### State the T-Values

Confidence Level = 90%, degrees of freedom = 8

Confidence Level = 60%, degrees of freedom = 12

Confidence Level = 98%, degrees of freedom = 25

### Examples:

A principal claims the students spend at least 10 hours per week doing homework, on average. A random sample of 250 students selected at random finds the mean to be 10.2 and the standard deviation to 4.2 hours.

- Construct a 95% confidence interval to see if the principal's claim is verified.
- Why did we use a t-distribution instead of a z-distribution?
- The counselor claims that students spend at least 16 hours per week doing homework, on average. Does the confidence interval verify her claim?

### Daily Data Collection 1

Find a 95% confidence interval for the true mean value of  
"The annual salary of your desired career"

**Parts of the formula:**  $\bar{x} =$  \_\_\_\_\_  $n =$  \_\_\_\_\_  $s_x =$  \_\_\_\_\_  
Degrees of freedom = \_\_\_\_\_  $t =$  \_\_\_\_\_

1. Describe the distribution of  $\bar{x}$
2. Find MOE = \_\_\_\_\_ Lower = \_\_\_\_\_ Upper = \_\_\_\_\_
3. Give the AP Statement

### Daily Data Collection 2

Find a 90% confidence interval for the true mean value of  
"The amount of your future annual salary that should be paid in taxes"

**Parts of the formula:**  $\bar{x} =$  \_\_\_\_\_  $n =$  \_\_\_\_\_  $s_x =$  \_\_\_\_\_  
Degrees of freedom = \_\_\_\_\_  $t =$  \_\_\_\_\_

1. Describe the distribution of  $\bar{x}$
2. Find MOE = \_\_\_\_\_ Lower = \_\_\_\_\_ Upper = \_\_\_\_\_
3. Give the AP Statement

### Daily Data Collection 3

Find a 99% confidence interval for the true mean value of  
"The amount of your future annual salary that should be saving/invested"

**Parts of the formula:**  $\bar{x} =$  \_\_\_\_\_  $n =$  \_\_\_\_\_  $s_x =$  \_\_\_\_\_  
Degrees of freedom = \_\_\_\_\_  $t =$  \_\_\_\_\_

1. Describe the distribution of  $\bar{x}$
2. Find MOE = \_\_\_\_\_ Lower = \_\_\_\_\_ Upper = \_\_\_\_\_
3. Give the AP Statement
